

Zamzam water is "proven" to have more "energy" than other waters? how would you measure energy of water?

An interesting article on zamzam water quality from an independent/scientific" study...
<http://www.ncbi.nlm.nih.gov/pubmed/22138338>

The abstract mentions: *The average concentrations of As and NO(3) showed values three times higher than the WHO standards*

(thats arsenic and nitrate) but also interestingly concludes: *The alkalinity of Zamzam water and the presence of trace amounts of As and Li may cause the healing power.*

The study was carried out after a criticised BBC report in May 2011 that Zamzam was poisonous? you may also find this of interest: <http://www.islam21c.com/politics/2802-manhunt-comparing-the-pursuits-of-osama-bin-laden-and-ratko-mladic> and that the Zamzam well is actually part of a "natural" hydrogeological well (Wadi alluvium): <http://www.sgs.org.sa/english/earth/pages/zamzam.aspx>, which suggests that it could possibly get contaminated from over use of Nitrates etc and/or heavy metals form time to time?
